

TEACHING OF BIOCHEMISTRY FOR THE NURSING AND NUTRITION COURSES

Morais, V. D.; Oliveira, A. K. P.; Silva, S. K. M.; Lima, C. J.; Sousa Filho, J. F.
Depto. Bioquímica/CB, UFRN, Natal, RN.

The importance of Biochemistry subjects is unquestionable for all the health courses. Teachers can use multimedia kits, data show and Monitors for direct attendance to the students. These Monitors make questions and study guides of contents tough in classes. They follow teachers in practice and theory's classes. In order to improve the communication with the students, monitors had created an e-mail box and home pages. The monitors receive doubts and critics from the students with them. Music parodies involving content and portfolios also were created by Monitors. These portfolios are used when the students attend the Monitory; they have information about the students, content and the grade, after the test related the content. This grade has used to quantify the students performance. This educational practice has been taken for two months. With a student group was done Mann-Whitney U Test. It found p-level = 0,001045. This shows significant difference between student performance had attended the monitory system got a better improvement of their skills than the ones who had not taken it. As the students have the option of sending e-mail or access the home page created by the monitors and they could, at any time, ask their doubts. This made the method applied more attractive and they showed more interest about the subject.
